

Participant Technical Setup

Before the event

Please create or sign in to your Claude Console (<https://platform.claude.com/>) account **before the hackathon starts** so email verification does not delay you at the start of the workshop. You can also use an existing account.

Here is a tutorial for getting the necessary Claude Credits. Note that the credit will be added to the active account/organisation.

Claude event credits

Anthropic provides **\$100 of API credit per participant**.

Claiming the event credit on Sep 23

1. Follow the claim link. It will be distributed at the registration desk on-site.
2. Sign in to/create your Anthropic account (same as in "Before the event").

3. Select "Individual" on the screen "How will you use the Claude API?"

4. Skip the initial buy credits step.

5. Fill in the application page for "AGD 2026 Rare-Disease Reanalysis Hackathon (Uni Bonn / TUM) Credits"

6. Wait for your \$100 credit to appear in your dashboard (usually within 5 minutes, but can take up to 2 hours)

The credit is valid for **90 days from the moment it is claimed**.

If you belong to several Console organisations, the credit is added to the one that was active when you claimed it.

Please choose the path that matches your experience:

Path A — Users with no programming experience

Recommended if you have little or no programming experience, or cannot install anything on your device

You can participate using [Claude Chat](#) (recommended) and the [Claude Console](#) (more complex, for testing prompts and building repeatable AI workflows). You do not need to install Claude Code, VS Code, Git, or a terminal environment for the introductory exercises.

Note: Claude Chat (<https://claude.ai/>) is a separate system to Claude Console. The event credit (details above) is API credit for the Console only — Claude Chat runs on your free daily quota, so for Path A the credit is optional and only used if you try the Console.

Path B — Users with programming and Claude Code experience

Recommended if you already have coding experience and use VS Code or a similar editor, and feel comfortable with a terminal and Git.

Option 1: use GitHub Codespaces

Requirements: a GitHub account and a fork of the workshop repository (see [Shared project workspace](#) below — fork first, then come back here).

Instead of installing Claude Code and the other tools locally, you can open a cloud-based development environment from [your forked workshop repository](#) using [GitHub Codespaces](#). Codespaces provides a browser-based editor and terminal connected directly to your fork, and the organisers will configure it with Claude Code and the other tools needed for the challenges. This means you do not need to clone the repository, install VS Code, or set up the development environment on your own computer. You can edit files, run commands, commit, and push from the Codespace directly to your fork. This should make it easier to share work with your team and for the technical steward to review and merge it into the team project.

setup via GitHub

1. From [your forked workshop repository](#), click the green "Code" button at the top right.
2. Click the "Codespaces" tab.
3. Click "Create codespace on main"

4. VS Code opens in your browser in the existing repository, the automatic installation process can take up to 5 minutes. At the end of the setup, click "Trust Folder & Continue"
5. Once it is done, you see a terminal on the bottom. If it doesn't seem to function properly, open up a fresh one by clicking on the + on the top right corner of the terminal. For the next steps, you can either work in terminal, or alternatively use the pre-installed Claude extension for VS Code. We show the terminal path:
6. Type "claude" in, choose the display mode you like, and choose "Anthropic console account" as login method

7. Then "sign in with your console account" and **press cancel** on "Do you want Code to open the external website?"

8. Instead, copy-paste the long link that appeared in the terminal in your browser, choose "Default" workspace, authenticate, and copy-paste the long code appearing on screen back into the VS code terminal

9. After successful login, Claude Code asks a few first-run questions (terminal setup and whether you trust the files in this folder). Accept the defaults, confirm, and you are ready to go!

You can now work directly in this space on the workshop files using AI Chat and Claude Code.

Option 2: use Claude Code locally on your computer

Recommended software:

- VS Code or another editor
- Git
- Claude Code
- GitHub account

Ideally, you install Claude Code **before the event** — either the terminal tool, the VS Code extension, the desktop app, or any combination. Follow the installation instructions for your system here: <https://code.claude.com/docs/en/overview>

⚠ Claude Code users: make sure you use the hackathon credits and not personal credits

After installation and claiming the event credit:

via a terminal

1. In Claude Code (run `claude` in a terminal), run `/login`. If you are already signed in, run `/logout` first.
2. Select **Anthropic Console account (API usage billing)**. **Do NOT select:** "Claude account with subscription"

3. Select **Sign in with your Console account**.

4. Select **default** workspace and authorise this when the browser opens for login.

5. Run `/status` to check which account/billing method is active.

After the hackathon, run `/logout`, then `/login` again to switch back to your normal Claude account with subscription.

via VS Code

1. Click the Claude Code icon in the top right tool bar, or type `/login` in the already open Claude Code side panel.

2. Choose **Anthropic Console**. Do NOT select: “Claude account with subscription”
3. Allow opening of the external link.
4. Follow prompts for login and authorisation.
5. Type `/status` in the Claude Code panel to check which account/billing method is active.

Working with your team

The workshop is designed for teams of approximately four people, combining clinical scientists and bioinformaticians. We suggest that **one experienced bioinformatician takes the role of technical steward, handling the final project repository, data, and files.**

Shared project workspace

The workshop GitHub repository is the main shared workspace for team projects.

Workshop GitHub repository:

[AGD-genome-reanalysis-hackathon](#)

1. Please fork the repo (button near the top right)

2. Keep the suggested name, leave "Copy the main branch only" checked, and click "Create fork". You find a copy of the repository in your own GitHub account, which you can either edit in the browser, or clone on your local machine, edit, and push changes with git.
3. Create a subdirectory for your team with a creative (and unlikely to be duplicated) name under `session-2/projects`. Please push your work here, including your final presentation and working prototype.

Talos setup

The hackathon uses a **pinned Talos 11.0.1 environment**.

The organisers will provide prepared Talos 11.0.1 outputs and workshop data so participants do not need to spend the hackathon setting up the complete Talos pipeline.

More technically experienced participants who want to work directly with Talos source code can use the following Talos 11.0.1 release: <https://github.com/populationgenomics/talos/releases/tag/v11.0.1>. This can be done using the following command, for example:

```
git clone https://github.com/populationgenomics/talos.git --branch v11.0.1
```

However, for Talos to work as a complete pipeline, many dependencies and large annotation datasets are required. We therefore recommend using the supplied output files as the basis for all challenges rather than running the pipeline during the hackathon.

Data and AI safety

Do not use patient-identifiable or confidential clinical data with Claude.

The hackathon provides synthetic/public data. Do not paste patient identifiers, confidential clinical reports, unpublished confidential patient data, credentials, passwords, API keys, or other secrets into Claude. **The organisers of the hackathon are not liable for any data privacy breaches related to participants using sensitive data with any AI-based agent or tool.**

If you get stuck

There will be on-site support, including help with Claude account setup, Claude Console, event credit claiming, Claude Code installation, login/authentication, and basic troubleshooting.

For the hackathon itself, do not build infrastructure from scratch. Start with the provided materials and get something working first.

Quick checklist

Everyone

- ☐ Anthropic/Claude account created or tested
- ☐ Email verification completed before the event
- ☐ Event claim link used when released
- ☐ \$100 Console API credit claimed
- ☐ Correct Console organisation checked (the one the credit was added to)
- ☐ GitHub account available
- ☐ Workshop GitHub repository accessible

Path A: Claude Chat and Console participants

- ☐ Claude Chat account accessible (web or app)
- ☐ Claude Console accessible

Path B: Claude Code participants

- ☐ Workshop GitHub forked
- ☐ Codespace created

OR

- ☐ VS Code or similar editor
- ☐ Git installed
- ☐ Claude Code installed
- ☐ Claude Code logged into **Anthropic Console account (API usage billing)**
- ☐ `/status` checked
